With temperature stress, plant thermal acclimation mechanisms include the accumulation of compatible nitrogen-rich solutes, such as AAs, that confer stress tolerance because they act as osmolytes (regulating ion transport and stomatal opening), they have an enzyme-protecting effect and influence gene expression and redox homeostasis (Botta, 2013). This increase in free AAs naturally originates from hydrolysis of functional proteins or inhibition of new protein synthesis.

Plant stress measurement is the quantification of environmental effects on plant health. When plants are subjected to less than ideal growing conditions, they are considered to be under stress. Stress factors can affect growth, survival and crop yields. Plant stress research looks at the response of plants to limitations and excesses of the main abiotic factors, and of other stress factors that are important in particular situations. Plant stress measurement usually focuses on taking measurement
