Peak flow measurement is a quick test to measure air flowing out of the lungs. The measurement is also called the peak expiratory flow rate (PEFR) or the peak expiratory flow (PEF). Peak flow measurement is mostly done by people who have asthma. Peak flow measurement can show the amount and rate of air that can be forcefully

breathed out of the lungs.

Peak flow scores will vary depending on

your age, your height and whether you're a man or a woman. The expected values are higher in younger people, taller people and men. Peak expiratory flow (PEF) is measured in litres per minute. Normal adult peak flow scores range between around 400 and 700 litres per minute, although scores in older women can be lower and still be normal. The most important thing is whether your score is normal for you.

Peak flow meters come in two ranges to

measure the air pushed out of your
lungs. A low-range peak flow meter is for
small children, and a standard-range
peak flow meter is for older children,
teenagers and adults. An adult has much
larger airways than a child and needs
the larger range. There are several types
of peak flow meters available.
