Adaptive Space Time Processing For

Space-time adaptive processing (STAP) is a signal processing technique most commonly used in radar systems. It involves adaptive array processing algorithms to aid in target detection. Radar signal processing benefits from STAP in areas where interference is a problem (i.e. ground clutter, jamming, etc.). Through careful application of STAP, it is possible to achieve order-of-magnitude sensitivity improvements in target detection.

STAP techniques filter the signal in both the angular and Doppler domains (thus, the name "space-time adaptive processing") to suppress the clutter and jammer returns. In the following sections, we simulate returns from target, clutter, and jammer and illustrate how STAP techniques filter the interference from the received signal. System Setup

A technique called space time adaptive processing (STAP) can be used to find targets that could otherwise not be detected. Because the jammer is transmitted continuously, its energy is present in all the range bins. And, as shown in Figure 1, the jammer cuts across the all Doppler frequency bins due to its wideband, noise-like nature.

Space-Time Adaptive Processing: Fundamentals

Abstract:This tutorial provides a brief overview of space-time adaptive processing (STAP) for radar applications. We discuss space-time signal diversity and various forms of the adaptive processor, including reduced-dimension and reduced-rank STAP approaches. Additionally, we describe the space-time properties of ground clutter and noise-jamming, as well as essential STAP performance metrics.
