Maxwell Betti Law Of Reciprocal

Betti's theorem, also known as Maxwell-Betti reciprocal work theorem, discovered by Enrico Betti in 1872, states that for a linear elastic structure subject to two sets of forces {Pi} i=1,...,n and {Qj}, j=1,2,...,n, the work done by the set P through the displacements produced by the set Q is equal to the work done by the set Q through the displacements produced by the set P. This theorem has applications in structural engineering where it is used to define influence lines and derive the bounda

Maxwell Betti's Reciprocal Theorem: According to this law the amount of work done by first load system due to displacements due to second load system, is equal to the amount of work by the second load system due to displacements due to first load system at their respective co-ordinates. In other words, if a load W is applied at A resulting a deflection "d" at B, then if same load W is applied at B, it will give the same deflection "d" at A.

Castigliano's Theorem, Maxwell Betti's Reciprocal Theorem

Maxwell-Betti law of reciprocal deflections: The Maxwell-Betti law helps reduce the computational efforts required to obtain the flexibility coefficients for the compatibility equations. This law states that the linear displacement at point A due to a unit load applied at B is equal in magnitude to the linear displacement at point B due to a unit load applied at A for a stable elastic structure.
