Abstract We introduce a probabilistic formulation that unifies medical image recognition, segmentation, and parsing into one modeling framework based on a rough-to-exact shape representation. We then present schemes to decompose a highly complex problem into several simple subproblems, leading to a general-purpose

computational pipeline.

Medical Image Recognition, Segmentation and Parsing ...

Medical image recognition, segmentation, and parsing are essential topics of medical image analysis. Medical image recognition is about recognizing which objects are inside a medical image. In principle, it is not

necessary to detect or localize the objects for object recognition; but in practice, often it is beneficial to associate object recognition with object detection or localization.

Abstract: Deep learning-based semi-supervised learning

(SSL) algorithms have led to promising results in medical images segmentation and can alleviate doctors' expensive annotations by leveraging unlabeled data. However, most of the existing SSL algorithms in literature tend to regularize the model training by perturbing networks and/or data. Observing that multi/dual-task learning attends to various levels of information which have inherent prediction perturbation, we ask the question in ...

Medical Image Recognition, Segmentation and Parsing ...

Segmentation is the process of partitioning an image into different meaningful segments. In medical imaging,

these segments often correspond to different tissue classes, organs, pathologies, or other biologically relevant structures. Medical image segmentation is made difficult by low contrast, noise, and other imaging ambiguities.

Medical image computing - Wikipedia

Image segmentation is typically used to locate objects and boundaries (lines, curves, etc.) in images. More precisely, image segmentation is the process of assigning a label to every pixel in an image such that pixels with the same label share certain characteristics.

Abstract: Although deep neural networks have been a dominant method for many 2D vision tasks, it is still challenging to apply them to 3D tasks, such

as medical image segmentation, due to the limited amount of annotated 3D data and limited computational resources. In this chapter, by rethinking the strategy to apply

3D Convolutional Neural Networks to segment medical images, we propose a novel 3D-based coarse-to-fine framework to efficiently tackle these challenges.
