1. Introduction. Subspace identification is by now a well-accepted method for identification of multivariable linear systems (Van Overschee & De Moor, 1994; Verhaegen, 1994). Recently, subspace methods have been developed to handle certain classes of nonlinear systems, like Wiener (Westwick & Verhaegen, 1996; Chou & Verhaegen, 1999), Hammerstein (Verhaegen & Westwick, 1996), and bilinear systems (Favoreel, De Moor, & Van Overschee, 1999; Favoreel, 1999; Chen & Maciejowski, 2000; Verdult, ...

In mathematics, specifically in control theory, subspace identification (SID) aims at identifying linear time invariant (LTI) state space models from input-output data. SID does not require that the user parametrizes the system matrices before solving a parametric optimization problem and, as a consequence, SID methods do not suffer from problems related to local minima that

often lead to unsatisfactory identification results.
