Beta Decay Of Neutron Rich

β^- -decay properties of neutron-rich Ca isotopes have been obtained. Half-life values were determined for the first time for 54 Ca (86 ± 7 ms), 55 Ca (22 ± 2 ms), and 56 Ca (11 ± 2 ms). The half-life of 230 ± 60 ms deduced for 53 Ca is significantly longer than reported previously, where the decay chain $53 \text{ K} \rightarrow 53 \text{ Ca} \rightarrow 53 \text{ Sc}$ was considered.

There are the following forms of beta decay: Negative Beta Decay - Electron Decay. In electron decay, a neutron-rich nucleus emits a high-energy electron (β^- particle). The electrons are negatively charged almost massless particles Due to the law of conservation of electric charge, the nuclear charge must increase by one unit.

Beta Decay - Beta Radioactivity - Nuclear Power

decay generally occurs in neutron-rich nuclei. The generic equation is: $A \text{ Z X} \rightarrow A \text{ Z+1 X'} + e^- + \nu_e$. where A and Z are the mass number and atomic number of the decaying nucleus, and X and X' are the initial and final elements, respectively. Another example is when the free neutron (1 0 n) decays by β^- decay into a proton (p): $n \rightarrow p + e^- + \nu_e$.

(Fission products do not decay via alpha decay.) A few neutron-rich and short-lived initial fission products decay by ordinary beta decay (this is the source of perceptible half life, typically a few tenths of a second to a few seconds), followed by immediate emission of a neutron by the excited daughter-product. This process is the source of ...

Nuclear fission product - Wikipedia

After prompt fission neutron emission the residual fragments are still neutron rich and undergo a beta decay chain. The more neutron rich the fragment, the more energetic and faster the beta decay. In some cases the available energy in the beta decay is high enough to leave the residual nucleus in such a highly excited state that neutron emission instead of gamma emission occurs.

Beta-Plus Decay: In beta plus decay, the proton disintegrates to yield a neutron causing a decrease in the atomic number of the radioactive sample. The nucleus experiences a loss of proton but gains a neutron. Again, conservation of charge is important. The beta plus decay in order to obey the conservation law also yields a positron and a neutrino.

Neutron rich nuclei spring many surprises in their low energy structure due to the diffuse nuclear surface. Major differences from stable nuclei are observed, like the vanishing of the N=20 shell closure for Z=10-12. The most likely mode of decay for a neutron-rich nucleus is one that converts a neutron into a proton. Every neutron-rich radioactive isotope with an atomic number smaller than 83 decays by electron (β^-) emission. ^{14}C , ^{32}P , and ^{35}S , for example, are all neutron-rich nuclei that decay by the emission of an electron. Neutron-poor nuclides decay by modes that convert a proton into a neutron. Neutron-poor nuclides with atomic numbers less than 83 tend to decay by either electron capture or ...
