One of the most promising methods for solving this problem is the "analytical redundancy" approach, in which residual signals are obtained. The basic idea consists of using an accurate model of the system to mimic the real process behaviour. If a fault occurs, the residual signal, i.e., the difference between real system and model behaviours, can be used to diagnose and isolate the malfunction.

A Guide to Fault Detection and Diagnosis

Method based on analytic model. A system-level fault diagnosis is based on analytic model constructs, residual signals to reflect the inconsistency between the desired system behavior, and practical operation modes by using the precise mathematical model of the system and observable input and output signals, and then a fault diagnosis is performed based on the analysis of the residual signals. It makes use of the whole deep understanding of the internal system and has a good diagnosis effect.
